Bonn, 25. January 2008

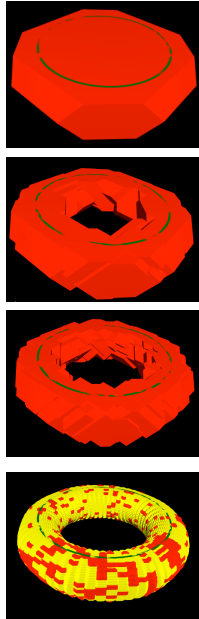

Bounding Volume Hierarchies

- BVHs are standard DS for collision detection ...
- ... but not just for collision detection!
 - Can be applied to ray-tracing, occlusion culling, etc.

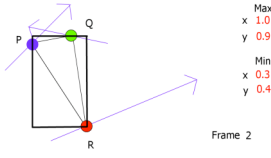

- Pre-processed hierarchy becomes invalid when object deforms
 - BVH must be rebuilt or updated after deformations

Intro Kinetic BVHs Kinetic Continuous Coll. Det. Kinetic Ray Tracing Conclusion

Brute Force Update and Variants

- Problems of Brute-Force Updates:
 - Many update operations
 - No use of temporal coherence
- Other approaches:
 - Hybrid updates [van den Bergen, 1998]
 - Inflation and lazy updates of the BVs [Mezger et al. 2003]
 - Restriction of deformation schemes [James and Pai, 2004]
 - Intrinsic collision test on the GPU [Wong and Baciuc 2005]
 - Chromatic decompositions [Govindaraju et al. 2005]
 - BVH reconstruction [Saarbrücken, 2006]

Kinetic Ray Tracing
Conclusion

Our Approach

- Observation:
 - Motion in the physical world is normally continuous
 - Changes in the **combinatorial structure** of the BVHs occur only at **discrete** time points
- We store **only** the combinatorial structure of the BVH and use an event-based approach for updating (**kinetization**)

Conclusion

Kinetic Toy Example

Max
x Q
y Q

Min
x P
y R

Event Queue
($t_1, Q, R, \text{Max } x$)

Intro Kinetic BVHs Kinetic Continuous Coll.Det. Kinetic Ray Tracing Conclusion

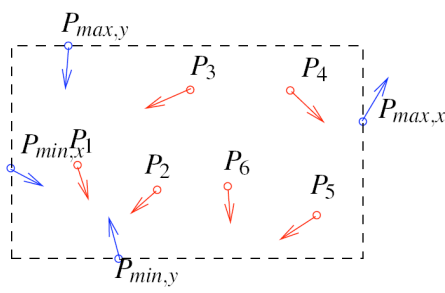

Advantages

- Fewer update operations
- Valid BVHs at every point in time
- Independent of query sampling frequency
- Can handle all kinds of objects
 - polygon soups (point clouds, and NURBS models)
- Can handle insertions/deletions during run-time
- Can handle all kinds of animated deformations
 - Only a **flightplan** is required for every vertex
 - These flightplans may change during simulation

Intro Kinetic BVHs Kinetic Continuous Coll.Det. Kinetic Ray Tracing Conclusion

Recap: Kinetic Data Structures

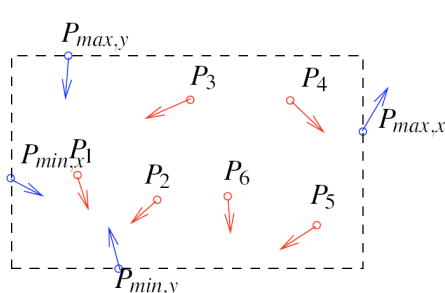

- **KDS** are a framework for designing and analyzing algorithms for objects in motion [Basch et al. 1997]
- KDS framework leads to event-based algorithms that "sample" the state of parts of a system only as often as necessary for a special *task* (e.g. a bounding box)

Intro Kinetic BVHs Kinetic Continuous Coll.Det. Kinetic Ray Tracing Conclusion

KDS terminology

- The task is called the **attribute**
- A KDS consists of set of **certificates**
- Certificate failures are called **events** → event queue
- If the attribute changes at the time of an event, the event is called **external**, otherwise **internal**

Intro Kinetic BVHs Kinetic Continuous Coll.Det. Kinetic Ray Tracing Conclusion

Quality of a KDS

- A KDS is **compact**, if it requires only little space
 - Space = number of certificates
 - Little = should not exceed static data structure by "too much"
- A KDS is **responsive**, if we can update it quickly in case of a certificate failure
 - Depends on number of certificates
 - Quickly = e.g. $O(\log(\text{number of certificates}))$
- A KDS is **local**, if one object is not involved in too many events
 - Depends on number of certificates
 - Not too many = e.g. $O(\log(\text{number of certificates}))$
- A KDS is **efficient**, if the ratio of internal events to external events is reasonable
 - Desirable is: $O(1)$ or less

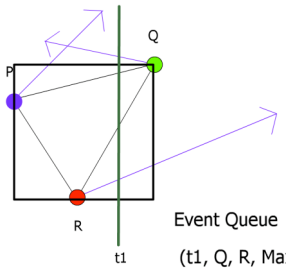

Intro **Kinetic BVHs** Kinetic Continuous Coll.Det. Kinetic Ray Tracing Conclusion

Kinetic AABB Tree

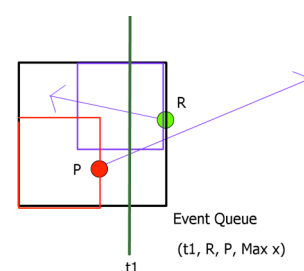

- Kinetization of the AABB tree
- Pre-processing: Build the tree by any algorithm suitable for static AABB trees
 - For a theoretical analysis, it is only required that the height of the BVH is logarithmic
- Store with every node the indices of those points that determine the BV (the "**realizing points**")
- Initialize the event queue

Intro **Kinetic BVHs** Kinetic Continuous Coll.Det. Kinetic Ray Tracing Conclusion

The Events

- Leaf Event:
 

Event Queue
($t_1, Q, R, \text{Max } x$)

Max
x Q
y Q
Min
x P
y R
- Inner node event:
 - Is determined by only 2 points of its 2 children
 

Event Queue
($t_1, R, P, \text{Max } x$)
- Flightplan Update Event

Intro Kinetic BVHs Kinetic Continuous Coll.Det. Kinetic Ray Tracing Conclusion

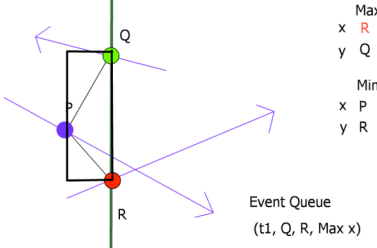

The Simulation Loop

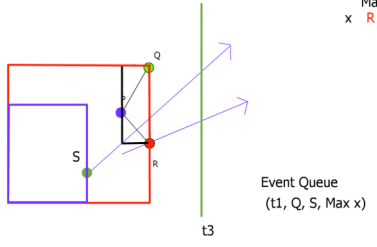

```

while simulation runs
  determine time  $t$  of next frame
   $e \leftarrow$  min event in event queue
  while  $e.timestamp < t$ 
    process event  $e$ 
     $e \leftarrow$  min event in event queue
    check for collisions (or cast ray, or ...)
  render scene
  
```

Intro Kinetic BVHs Kinetic Continuous Coll.Det. Kinetic Ray Tracing Conclusion

Event Handling at Run-Time

- Leaf Events:
 - At the bottom of the AABB:
 

Event Queue
($t_1, Q, R, \text{Max } x$)
 - Propagation through the tree:
 

Event Queue
($t_1, Q, S, \text{Max } x$)

Intro **Kinetic BVHs** Kinetic Continuous Coll.Det. Kinetic Ray Tracing Conclusion

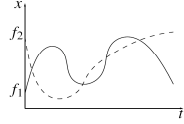

Analysis

- Theorem 1:

Given a 2-manifold mesh with n vertices.
 The kinetic AABB tree is **compact** (num. certificates = $O(n)$),
local ($O(\log n)$), **responsive** (one event = $O(\log n)$) and
efficient.

Furthermore, the kinetic AABB tree is a valid BVH at every point in time.
- Theorem 2:

Given n vertices, we assume that each pair of flightplans intersect at most s times.
 Then, the total number of events is in nearly $O(n \log n)$.

- Remark: this bound is **independent** of the query frequency.

Intro **Kinetic BVHs** Kinetic Continuous Coll.Det. Kinetic Ray Tracing Conclusion

The Kinetic Boxtree

- Problem: the kinetic AABB tree needs up to 6 events for every BV
- Idea: a kinetic Boxtree
 - A.k.a.: bounding interval hierarchy (BIH), SKD tree
 - Property: combination of k-d tree and AABB
 - Advantage: uses less memory than the kinetic AABB tree
 - Only 1 "splitting plane" per BV → only 1 event per BV

AABB tree

BoxTree

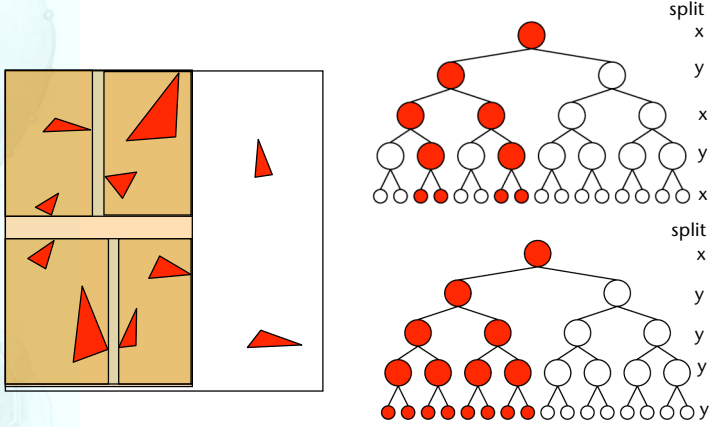

Intro Kinetic BVHs Kinetic Continuous Coll.Det. Kinetic Ray Tracing Conclusion

Event Computation

- 1D example:

Intro Kinetic BVHs Kinetic Continuous Coll.Det. Kinetic Ray Tracing Conclusion

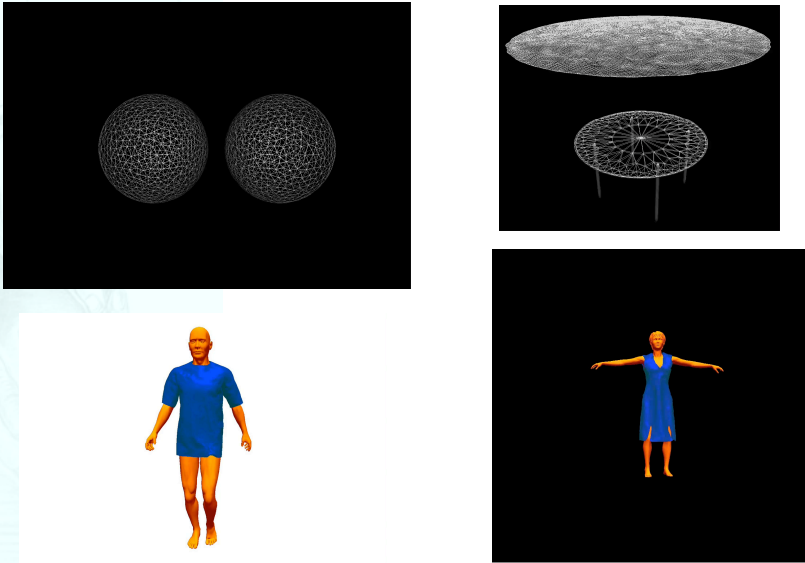

■ In 3D:

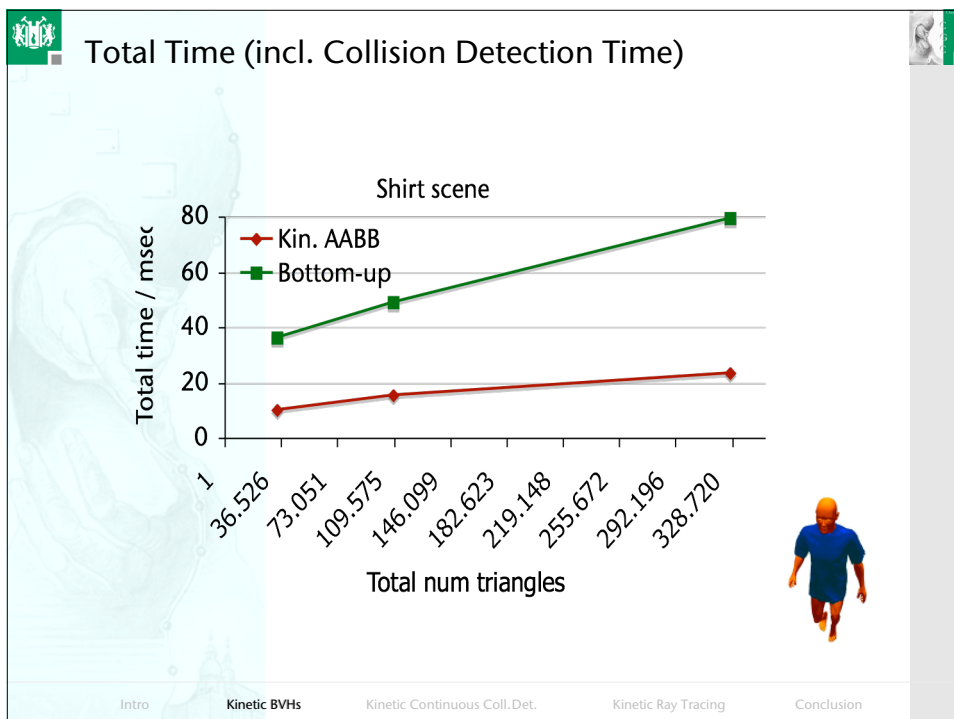

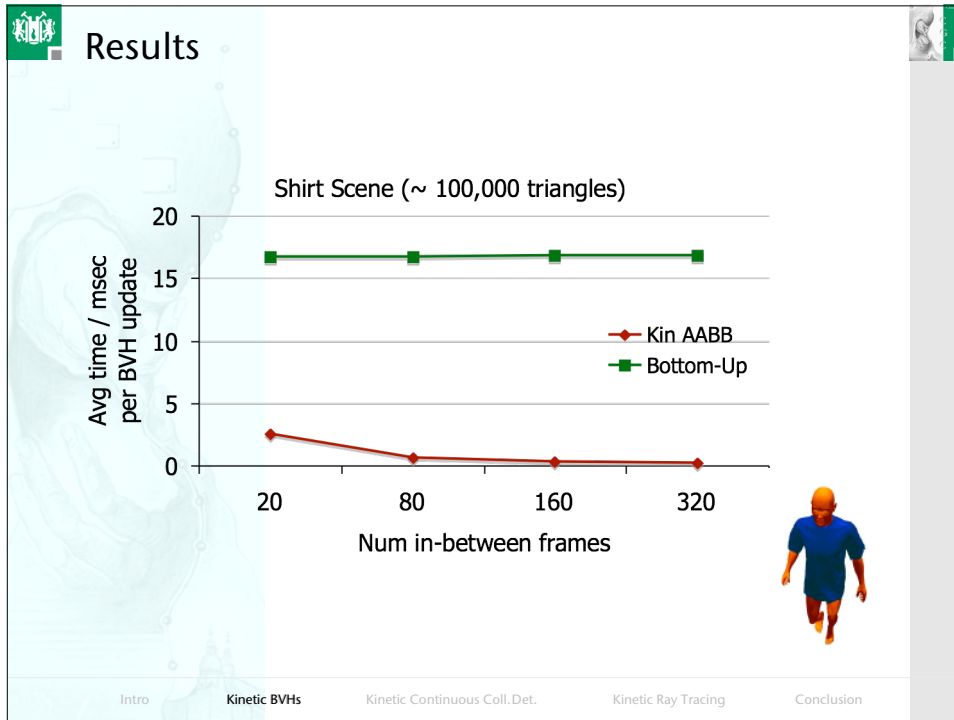

■ Analysis:
 The kinetic BoxTree is compact, local and efficient.
 But not responsive.

Intro **Kinetic BVHs** Kinetic Continuous Coll.Det. Kinetic Ray Tracing Conclusion

Test Scenes

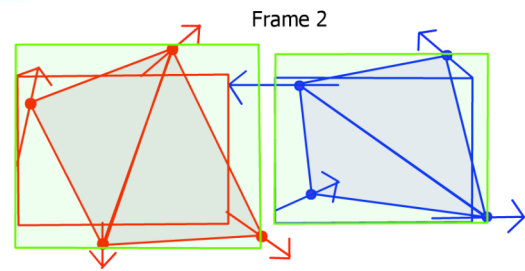

Intro **Kinetic BVHs** Kinetic Continuous Coll.Det. Kinetic Ray Tracing Conclusion

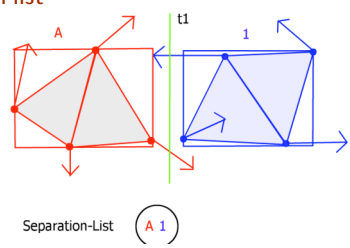

Kinetic Separation Lists for Continuous Coll.Det.

- Continuous collision detection = determine earliest time of contact
- Conventional approach: swept volumes

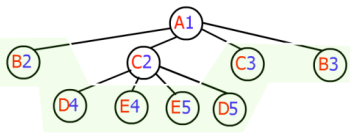

- Problems:
 - Same as for static BVH updates
 - Swept volumes are too large

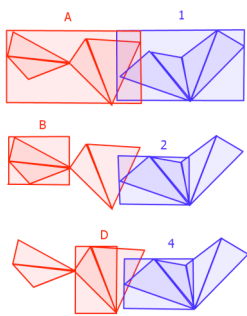

Intro Kinetic BVHs Kinetic Continuous Coll.Det. Kinetic Ray Tracing Conclusion

- Idea:
 - Maintain the list of nodes of the bounding-volume test tree (BVTT) where the simultaneous traversal stopped
 - Kineticize this list → "kinetic separation list"
- Toy example:
 
- Advantages:
 - Continuous collision detection is reduced to the **discrete** problem of determining changes in the separation list
 - Collisions are automatically reported in the correct order
 - Inter-object and self-collision detection

Intro Kinetic BVHs Kinetic Continuous Coll.Det. Kinetic Ray Tracing Conclusion

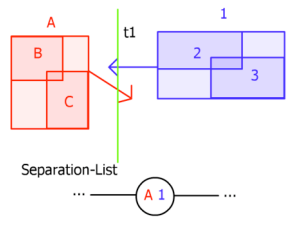

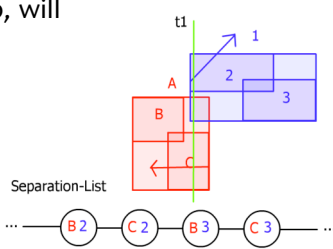

Initialization of the Kinetic Separation List (KSL)

- Traverse the 2 BVHs of the 2 objects as usual
 - For self collision detection: Test object against itself
- Compute separation list and initial events:
 - Separation list = set of pairs of nodes
 - Pair of nodes \in separation list \Leftrightarrow
 - BVs have been reached by traversal AND
 - BVs do not overlap OR nodes are leaves
- Example:
 

Intro Kinetic BVHs Kinetic Continuous Coll.Det. Kinetic Ray Tracing Conclusion

The Events

- Pair of BVs is in the KSL, will overlap at time t :
 
- Pair of parent BVs does overlap, will cease to overlap at time t :
 

Intro Kinetic BVHs Kinetic Continuous Coll.Det. Kinetic Ray Tracing Conclusion

Event Handling During Run-Time

- BVs begin to overlap at time t :

The diagrams illustrate the state of a Separation-List as two sets of bounding volumes (BV) overlap at time t_1 . In the first diagram, a red set (A, B, C) and a blue set (1, 2, 3) are shown overlapping. The Separation-List contains the entry A_1 . In the second diagram, the overlap is more pronounced, and A_1 remains in the list. In the third diagram, the overlap is resolved, and the Separation-List is updated to contain B_2, C_2, B_3, C_3 .

Intro Kinetic BVHs **Kinetic Continuous Coll.Det.** Kinetic Ray Tracing Conclusion

- Parent BVs will cease to overlap at time t :

The diagrams illustrate the state of a Separation-List as parent BVs cease to overlap at time t_1 . In the first diagram, the red set (A, B, C) and blue set (1, 2, 3) are shown separating. The Separation-List contains the entries B_2, C_2, B_3, C_3 . In the second diagram, the separation is complete, and the list remains the same. In the third diagram, the parent BVs have separated, and the Separation-List is updated to contain A_1 .

Intro Kinetic BVHs **Kinetic Continuous Coll.Det.** Kinetic Ray Tracing Conclusion

■ Topology of BV changes, i.e., extent is realized by other vertices:

Separation-List
 ... (A 1) ...

Separation-List
 ... (A 1) ...

Separation-List
 ... (A 1) ...

Intro Kinetic BVHs Kinetic Continuous Coll.Det. Kinetic Ray Tracing Conclusion

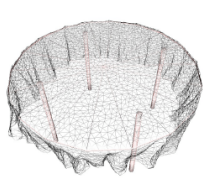

Analysis

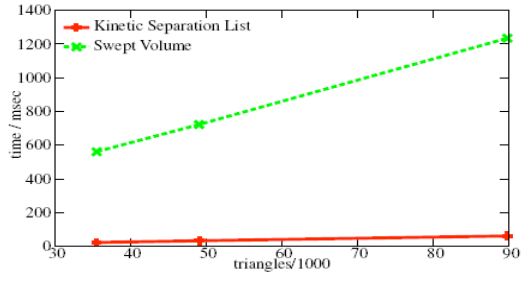

- Worst case:
- Theorem 1:
 In the worst case, our kinetic separation list is local ($O(n)$), responsive ($O(1)$), efficient, and, arguably, compact ($O(n^2)$).
- Theorem 2:
 In the average case, our kinetic separation list is local ($O(1)$), responsive ($O(1)$), efficient, and compact ($O(n)$).

Kinetic Ray Tracing of Animated Scenes

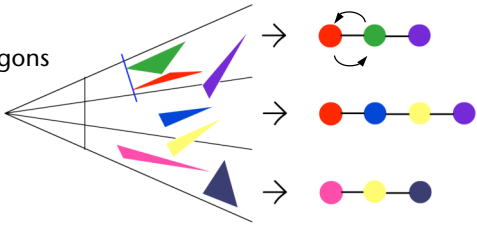

- Work in Progress
- Current challenge: animated scenes
- Current approaches: re-build acceleration data structure
 - kd-tree, grid

Intro Kinetic BVHs Kinetic Continuous Coll.Det. **Kinetic Ray Tracing** Conclusion

Overview of Our Approach

- Idea: **Kinetic Grid of Frusta**
 - Maintain sorted list of polygons for each pixel frustum
 - Events:
 - swap pair of polygons
 - delete / insert polygon
- Problem: Ordering polygons in a frustum (e.g. by kinetic ray casting) leads to high-order polynomials and "ugly" events
 - Track intersection points of polygons with the frusta
- Two Tasks:
 - Event-based polygon tracking
 - Kinetic sorting within frusta

Intro Kinetic BVHs Kinetic Continuous Coll.Det. **Kinetic Ray Tracing** Conclusion

Event-Based Polygon-Tracking

Intro Kinetic BVHs Kinetic Continuous Coll.Det. **Kinetic Ray Tracing** Conclusion

Kinetic Sorting within a Frustum

Intro Kinetic BVHs Kinetic Continuous Coll.Det. **Kinetic Ray Tracing** Conclusion

Advantages

- Independent of rendering frequency
 - E.g., rendering in slow motion without extra cost for updates or intersection tests
- Antialiasing for free
- No complicated mix of different data structures for dynamic and static objects
 - Static objects simply emit no events
- Can handle insertions/deletions during run-time
- Can handle all kinds of animated deformations
 - Only a flightplan is required for every vertex
 - These flightplans may change during simulation

Intro Kinetic BVHs Kinetic Continuous Coll. Det. **Kinetic Ray Tracing** Conclusion

Analysis

- Assumptions:
 - Num intersection between polygons and frusta is bounded
 - Num intersection of flightplans and frusta borders is bounded
- Event-based polygon tracking:
 - Compactness and total number of events: $O(n)$
 - Locality and Responsiveness: $O(1)$
- Kinetic sorting within frusta:
 - Compactness: $O(n)$
 - Locality and Responsiveness: $O(\log n)$ (kinetic tournament) or $O(1)$ (kinetic heap)
 - Num. events: $O(n \log n)$ (kin. tournament) or $O(n \log^2 n)$ (kin. heap)

Intro Kinetic BVHs Kinetic Continuous Coll. Det. **Kinetic Ray Tracing** Conclusion

Conclusions

- Novel, event-based data structures (KDS) for
 - Updating BVHs
 - Continuous collision detection and self-collision detection
 - Ray tracing
- BVH update is in $O(n \log n)$
 - Dito for *Kinetic Grid of Frusta*
- Uncoupling of data structure updating from query frequency
 - Computational effort for coll.det. **independent** of num. in-betweens
 - Dito for ray casting of primary rays
- Coll. det. is up to 50 times faster than swept volume approach in practically relevant scenarios

Intro Kinetic BVHs Kinetic Continuous Coll.Det. Kinetic Ray Tracing **Conclusion**

Future Work

- Use our kinetic data structures also for other kinds of primitives like NURBS
- Extend to scenarios with unknown flightplans
- Kinetic Light-buffers (for shadow rays)
- Improve performance of kinetic sorting within frusta by using *kinetic heaters* or *kinetic hangers*
- Integrate other kinetic data structures (like the kinetic AABB-Tree) for secondary rays
- Improve quality of anti-aliasing
- Parallelization

Intro Kinetic BVHs Kinetic Continuous Coll.Det. Kinetic Ray Tracing **Conclusion**
