

Logik für Informatiker

Logic for computer scientists

Till Mossakowski

WiSe 2007/08

Rooms

- Monday 13:00 - 15:00 GW2 B1410
- Thursday 13:00 - 15:00 GW2 B1410
- Exercises (bring your Laptops with you!)
 - either Monday 13:00 - 15:00 GW2 B1410 and MZH 5210 (Sergey)
 - or Wednesday 8:00 - 10:00 MZH 7250
- ... this will be decided on Monday 29th October, 13:00 - 15:00 GW2 B1410
- Web:
`www.informatik.uni-bremen.de/agbkb/lehre/ws07-08/Logik/`

The formal language PL1

PL1 is the formal language of **first- order predicate logic**

Why do we need a formal language?

⇒ Slides from Prof. Barbara König, Universität
Duisburg-Essen

[http://www.ti.inf.uni-due.de/teaching/ws0607/logik/folien/
einfuehrung.pdf](http://www.ti.inf.uni-due.de/teaching/ws0607/logik/folien/einfuehrung.pdf)

Problem: Natürliche Sprache ist mehrdeutig.

Beispiel:

Ich sah den Mann auf dem Berg mit dem Fernrohr.

((((Ich sah den Mann) auf dem Berg) mit dem Fernrohr)

((Ich sah (den Mann auf dem Berg)) mit dem Fernrohr)

((Ich sah den Mann) (auf dem Berg mit dem Fernrohr))

(Ich sah ((den Mann auf dem Berg) mit dem Fernrohr))

(Ich sah (den Mann (auf dem Berg mit dem Fernrohr)))

((((Ich sah den Mann) auf dem Berg) mit dem Fernrohr)

((Ich sah (den Mann auf dem Berg)) mit dem Fernrohr)

((Ich sah den Mann) (auf dem Berg mit dem Fernrohr))

(Ich sah ((den Mann auf dem Berg) mit dem Fernrohr))

(Ich sah (den Mann (auf dem Berg mit dem Fernrohr)))

5 mögliche
Interpretationen!

The language of PL1: individual constants

- **Individual constants** are symbols that denote a person, thing, object
- **Examples:**
 - Numbers: 0, 1, 2, 3, . . .
 - Names: Max, Claire
 - Formal constants: a, b, c, d, e, f, n1, n2
- Each individual constant must denote an existing object
- No individual constant can denote more than one object
- An object can have 0, 1, 2, 3 . . . names

The language of PL1: predicate symbols

- **Predicate symbols** denote a property of objects, or a relation between objects
- Each predicate symbol has an **arity** that tell us how many objects are related
- **Examples:**
 - Arity 0: Gate0_is_low, A, B, . . .
 - Arity 1: Cube, Tet, Dodec, Small, Medium, Large
 - Arity 2: Smaller, Larger, LeftOf, BackOf, SameSize, Adjoins . . .
 - Arity 3: Between

The interpretation of predicate symbols

- In **Tarski's world**, predicate symbols have a **fixed interpretation**, that not always completely coincides with the natural language interpretation
- In other PL1 languages, the interpretation of predicate symbols may **vary**. For example, \leq may be an ordering of numbers, strings, trees etc.
- Usually, the binary symbol $=$ has a fixed interpretation: **equality**

Atomic
Sentence

Interpretation

Tet(<i>a</i>)	<i>a</i> is a tetrahedron
Cube(<i>a</i>)	<i>a</i> is a cube
Dodec(<i>a</i>)	<i>a</i> is a dodecahedron
Small(<i>a</i>)	<i>a</i> is small
Medium(<i>a</i>)	<i>a</i> is medium
Large(<i>a</i>)	<i>a</i> is large
SameSize(<i>a</i> , <i>b</i>)	<i>a</i> is the same size as <i>b</i>
SameShape(<i>a</i> , <i>b</i>)	<i>a</i> is the same shape as <i>b</i>
Larger(<i>a</i> , <i>b</i>)	<i>a</i> is larger than <i>b</i>
Smaller(<i>a</i> , <i>b</i>)	<i>a</i> is smaller than <i>b</i>
SameCol(<i>a</i> , <i>b</i>)	<i>a</i> is in the same column as <i>b</i>
SameRow(<i>a</i> , <i>b</i>)	<i>a</i> is in the same row as <i>b</i>
Adjoins(<i>a</i> , <i>b</i>)	<i>a</i> and <i>b</i> are located on adjacent (but not diagonally) squares
LeftOf(<i>a</i> , <i>b</i>)	<i>a</i> is located nearer to the left edge of the grid than <i>b</i>
RightOf(<i>a</i> , <i>b</i>)	<i>a</i> is located nearer to the right edge of the grid than <i>b</i>
FrontOf(<i>a</i> , <i>b</i>)	<i>a</i> is located nearer to the front of the grid than <i>b</i>
BackOf(<i>a</i> , <i>b</i>)	<i>a</i> is located nearer to the back of the grid than <i>b</i>
Between(<i>a</i> , <i>b</i> , <i>c</i>)	<i>a</i> , <i>b</i> and <i>c</i> are in the same row, column, or diagonal, and <i>a</i> is between <i>b</i> and <i>c</i>

Atomic sentences

- application of predicate symbols to constants: $\text{Larger}(a,b)$
- the **order** of arguments **matters**: $\text{Larger}(a,b)$ vs. $\text{Larger}(b,a)$
- Atomic sentences denote **truth values** (true, false)

Function symbols

- **Function symbols** lead to more complex **terms** that denote objects. Examples:
 - father, mother
 - $+$, $-$, $*$, $/$
- This leads to new terms denoting objects:
 - $\text{father}(\text{max})$ $\text{mother}(\text{father}(\text{max}))$
 - $3*(4+2)$
- This also leads to new atomic sentences:
 - $\text{Larger}(\text{father}(\text{max}), \text{max})$
 - $2 < 3*(4+2)$

Logical validity; satisfiability

A sentence A is a **logically valid**, if it is true in all circumstances.

A sentence A is a **satisfiable**, if it is true in at least one circumstance.

A **circumstance** is

- in propositional logic: a valuation of the atomic formulas in the set $\{ \text{true}, \text{false} \}$
- in Tarski's world: a block world

Logical consequence

A sentence B is a **logical consequence** of A , if all circumstances that make A true also make B true.

In symbols: $A \models B$.
