4. Families of Systems

Overview of SCS4, Again

1. *rigorous description* of requirements

2. *what information* should be provided
   in computer system documentation?

3. *decomposition* into modules

4. *families* of systems

Overview of Chapter 4: Families of Systems

4.1 motivation:

  maintenance problems in telephone switching

4.2 families of programs

4.3 families of requirements

# 4.1 Motivation: Maintenance Problems in Telephone Switching

Overview of Chapter 4.1

- background
  on telephone switching

- feature interaction problems
  in telephone switching

History of Telephone Switching Systems

. . .	. . .
1950s	direct distance dialling (DDD)
	No. 5 Crossbar
early 1960s	stored program control switches
1976	Signalling System No. 6
1980	*Signalling System No. 7*
1984	*ISDN*
currently	IP telephony

Signalling System No. 7

OSI model	SS7 architecture	
OSI model	**SS7 architecture**	

OSI model

application layer

presentation layer

session layer

transport layer

network layer

data link layer

physical layer

SS7 architecture

OMAP   ASEs

TC

ISUP   TUP

<empty>

SCCP

MTP Level 3

MTP Level 2

MTP Level 1

OMAP: Operations, Maintenance and Administration Part
ASE: Application Service Element
TC: Transactions Capabilities
ISUP: ISDN User Part
SCCP: Signalling Connection Control Part
MTP: Message Transfer Part
TUP: Telephone User Part

ISDN/DSS1

- **Integrated Services Digital Network**
- **basic service:**
  - two B-channels (64 kbit/s, transparent)
  - one D-channel (16 kbit/s, for signalling, e.g., call setup)
    - ▷ protocol: Digital Subscriber Signalling 1 (DSS1)
- **supplementary services:**
  - Calling Line Identification Presentation
  - Call Forwarding
  - Closed User Group
  - User-to-User Signalling
  - . . .

- fixed set of supplementary services

Intelligent Network (IN)

- extension of telephone switching systems
- general goals:
  - rapid introduction of new services
  - broaden range of services
  - multi-vendor environment
  - evolve from (all) existing networks
- standardized by ITU-T
- approach: base service & additional services/features
- new services step by step:
Intelligent Network Conceptual Model (INCM)

- four "levels":
  - service plane
  - global functional plane
  - distributed functional plane
  - physical plane

Global Functional Plane

- service independent building blocks (SIBs)
- service logic ("glue" for SIBs)
- basic call process
  - is special SIB
  - POI: point of initiation (of service)
  - POR: point of return

Services in IN CS-1

- Abbreviated dialling
- Account card calling
- Automatic alternative billing
- Call distribution
- Call forwarding
- Call rerouting distribution
- Completion of call to busy subscriber
- Conference calling
- Credit card calling
- Destination call routing
- Follow-me diversion
- Freephone
- Malicious call identification

- Mass calling
- Originating call screening
- Premium rate
- Security screening
- Selective call forward on busy / don't answer
- Split charging
- Televoting
- Terminating call screening
- Universal access number
- Universal personal telecommunications
- User-defined routing
- Virtual private network

- **25 services**
- **kind of services limited:**
  - mainly for call setup and call tear down
  - 1 customer and 1 call leg only, mostly
- **set is "political":**
  - some services very similar
    - ▷ taken from different sources, without proper merge
    - ▷ example: Televoting / Mass Calling

Features in IN CS-1

- Abbreviated dialling
- Attendant
- Authentication
- Authorization code
- Automatic call back
- Call distribution
- Call forwarding
- Call forwarding on BY/DA
- Call gapping
- Call hold with announcement
- Call limiter
- Call logging
- Call queueing
- Call transfer

- Call waiting
- Closed user group
- Consulation calling
- Customer profile management
- Customized recorded announcement
- Customized ringing
- Destinating user prompter
- Follow-me diversion
- Mass calling
- Meet-me conference
- Multi-way calling
- Off net access
- Off net calling
- One number

- Origin dependent routing
- Originating call screening
- Originating user prompter
- Personal numbering
- Premium charging
- Private numbering plan
- Reverse charging
- Split charging
- Terminating call screening
- Time dependent routing

- 38 features

Architecture of Distributed Functional Plane
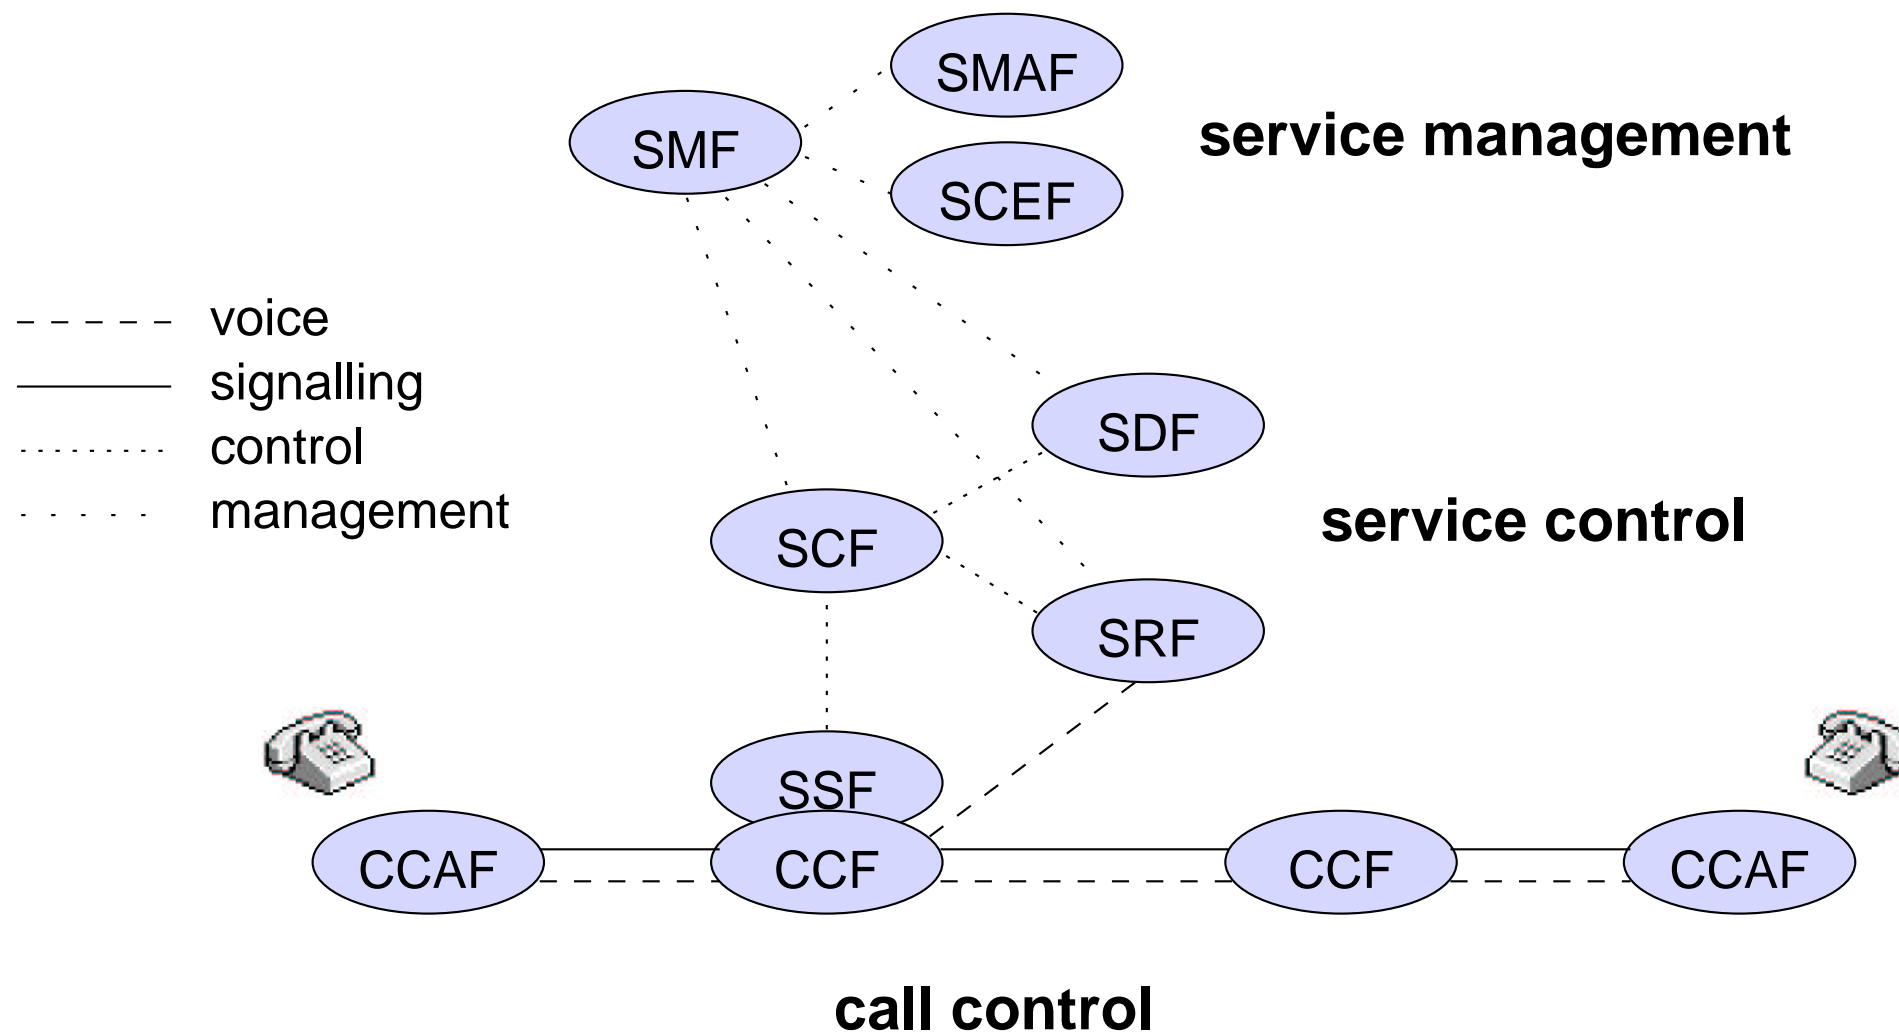

Basic Call State Model

- originating BCSM $\boxed{\textit{automaton}}$
- terminating BCSM $\boxed{\textit{automaton}}$

Feature Interaction Problems in Telephone Switching

- *features work separately, but not together*
  - hundreds of (proprietary) features
  - combinations cannot be checked anymore
- telephone switching
  - users' expectation high
- feature
  - about any increment of functionality

Calling Card & Voice Mail

- ## #-button
  - ◦ (Bell) calling card:
    start new call without re-authorization

  - ◦ (Meridian) voice mail:
    end of mailbox number, end of password, . . .

- ## call voice mailbox using calling card??
  - ◦ either early disconnect, or

  - ◦ calling card feature crippled

- ## resolution by Bell
  - ◦ introduce new signal:
    "#-button pressed at least 2 sec."

Call Waiting & Call Forward on Busy

- both activated simultaneously
  - in busy state
  - when another call arrives
- only one can get control
  - no resolution, except restrictions on features

Originating Call Screening & Area Number Calling

- ## OCS
  - aborts calls to numbers in list
  - query Service Data Point (SDP) for list
- ## ANC
  - dialled number + area(calling number) $\rightarrow$ called number
  - example: Domino's Pizza
 - query SDP for called number

- **switch may restrict no. of queries**
  - ○ protection against infinite loops
  - ○ e.g., one query per call
  - ○ → OCS subscription prevents orders for pizza

- **solution: one more query??**

Calling Number Delivery & Unlisted Number

- conflict of goals
  - ○ CND reveals caller
  - ○ UN prevents revealing caller
- resolution
  - ○ weaken one feature
  - ○ e.g.: CND delivers only 1-111-1111-1111
    for unlisted number

Call Forwarding & Terminating Call Screening

- CF
  - B forwards all calls to C

- TCS
  - when A is caller, C blocks him

- A calls B: can/should A reach C?

A ![phone]   **B** ![phone]   **C** ![phone] **?**

$\rightarrow$ **C**   **not A**
- notion of "caller" is crucial

Informal Feature Interaction Definition in Literature

- *FI:*

  the behaviour of a feature is changed by another feature

- not precisely clear what a feature actually is

- not all interactions are undesired

Categorization of Causes

according to [Cameron et. al.]:

- violation of feature assumptions
  - naming

  - data availability

  - administrative domain

  - call control

  - signalling protocol

- limitations on network support
  - limited CPE signalling capabilities

  - limited functionalities for communications among network components

- **intrinsic problems in distributed systems**

  ○ resource contention

  ○ personalized instantiation

  ○ timing and race conditions

  ○ distributed support of features

  ○ non-atomic operations

Approaches for Tackling FI

- ignore

- informal
  - ○ filtering

  - ○ heuristics

  - ○ . . .

- formal methods
  - ○ validation of:

    - ▷ specified properties of the features

    - ▷ general properties of the system
      (free of non-determinism, . . .)

- **new architectures**
  - ○ IN
  - ○ Tina, Race, Acts
  - ○ DFC, agents

- **better software engineering processes**

- **in practice: ignore / informal / processes / (architectures)**

- **formal analysis?**
  yes, but. . .
  - ○ formalization is huge task
  - ○ complexity not amenable to tools
    - ▷ "spaghetti code" dependences

Feature Interactions in the Requirements

- if requirements complete,
  all FI are (inherently) present in the requirements

Requirements Structuring Problems

- monolithic requirements or single layer of extension
  - ISDN: monolithic
  - IN: no features on top of features
  - CF & TCS: resolution needs extended, common notion of caller
  - CF & OCS: resolution needs extended, common notion of called user

- **new services depend implicitly on new concepts**
  - some new concepts:
    - ▷ conditional call setup blocking
    - ▷ dialled number translation
    - ▷ multi-party call/session
      - required for CF & TCS and for CF & OCS
    - ▷ service session without communication session
    - ▷ distinction user – terminal device
    - ▷ distinction user – subscriber
    - ▷ mobility of users and of terminals
      - difficult to specify with network of distributed switches
    - ▷ multiple service providers, billing separately

- **concerns of the users' interface are spread out**
  - several features asume exclusive access to the user's terminal device (12 buttons + hook)
  - example: calling card & voice mail

Needed: a More Modular Requirements Structure

- centralize responsibility for the users' interface
- a layered architecture
  - like in computer communication systems

New Architectures

- **current: IN**
  - currently largest impact on implementations
    - ▷ see above
  - Jain
    - ▷ enhanced IN-like architecture
    - ▷ developed currently
    - ▷ in Java
    - ▷ allows multi-party, multi-media calls
    - ▷ Java Call Control (JCC):
      call state machine similar to that of the IN
    - ▷ JCC does not handle feature interactions

- **future: Tina, Race, and Acts**
  - ○ Tina

    ▷ radical approach: entirely new architecture

    ▷ strongly based on Open Distributed Processing (ODP) and Corba

    ▷ migration difficult

  - ○ Race project
    - ▷ Cassiopeia
      - developed open services architectural framework (Osa)
      - many commonalities with Tina
      - focuses on requirements engineering of services
      - tries to take legacy services into account
    - ▷ Score
      - concerned with the methodological aspects of service creation
      - detection of undesired service interactions:
        formal methods, exhaustive simulation
        applied to small example

○ Acts project

  ▷ followed Race project

  ▷ application and on evaluation of service architectures

  ▷ result: a modified architecture

- **research: the DFC and the agent architecture**
  - ○ Distributed Feature Composition (DFC)
    - ▷ compose features in a pipe-and-filter network
    - ▷ designed to be implementable on a conventional switch
    - ▷ some new concepts supported, others not
    - ▷ no layered architecture
    - ▷ implemented in AT&T's Eclipse project,
      which additionally incorporates Voice Over IP
  - ○ Zibman et. al.'s agent architecture
    - ▷ separates several concerns explicitly
    - ▷ restricts itself to narrow-band telephony over a fixed network
    - ▷ Plain Old Telephone Service is represented by a single service agent

Discussion of New Architectures

- IN important step, but not sufficient
- Tina, Race, Acts have most of the interesting concepts, but transition is very expensive
- feature interaction detection is still research

- **some undesired service interactions still possible in new architectures**
  - ○ a paper checked the FI benchmark for Tina
  - ○ still possible:
    - ▷ forwarding loop
    - ▷ automatic callback & automatic re-call
    - ▷ calling number delivery & calling number delivery blocking
    - ▷ billing problems for video conference
    - ▷ . . .
  - ○ causes: violated assumptions or conflicting goals
- **_how to prepare for unanticipated changes??_**
  - ○ at least encapsulate as much as possible
